

Abstract of DE10057832

Blood analysis device has a syringe (8) mounted in a casing (4) and operated by an external plunger. An annular mounting (32) carries needles (12), each of which is mounted behind a test strip (30). The mounting is swiveled so that a needle cooperates with the syringe and the needle can be pushed through the test strip and an aperture in the casing to take a blood sample.
